
Django Absolute Documentation

Release 0.4.dev

Axel Haustant

November 13, 2013

Contents

Django Absolute provides context processors and template tags to use full absolute URLs in templates.

Installation

You can install Django Absolute with pip:

```
pip install django-absolute
```

or with easy_install:

```
easy_install django-absolute
```

Add `absolute` to your `settings.INSTALLED_APPS`.

Context processor

Add `absolute.context_processors.absolute` to your `settings.TEMPLATE_CONTEXT_PROCESSORS`. Django Absolute context processor depends on request context processor:

```
from django.conf import global_settings

TEMPLATE_CONTEXT_PROCESSORS = global_settings.TEMPLATE_CONTEXT_PROCESSORS + (
    'django.core.context_processors.request',
    'absolute.context_processors.absolute',
)
```

Then you can access the following variables in your templates:

- `ABSOLUTE_ROOT`: full absolute root URL (without trailing slash) based on incoming request
- `ABSOLUTE_ROOT_URL`: full absolute root URL (with trailing slash) based on incoming request
- `SITE_ROOT`: full absolute root URL (without trailing slash) based on current Django Site
- `SITE_ROOT_URL`: full absolute root URL (with trailing slash) based on current Django site

Template tags

Django absolute provide 2 template tags:

- `absolute`: acts like `url` but provide a full URL based on incoming request.
- `site`: acts like `url` but provide a full URL based on current Django Site.

To use theses template tags, you need to load the `absolute` template tag library.

```
{% load absolute %}

{% url index %}
{% absolute index %}
{% site index %}
```

These template tags have exactly the same syntax as `url`, including the “`as`” syntax:

```
{% absolute index as the_url %}
{{ the_url }}
```

If you use Django 1.5, you need to use the “new-style” url syntax (quoted parameters):

```
{% load absolute %}

{% url "index" %}
{% absolute "index" %}
{% site "index" %}

{% absolute "index" as the_url %}
{{ the_url }}
```

If you want to match the “new-style” syntax in Django < 1.5 you need to load `absolute_future` instead (same behavior as `{% load url from future %}`).

```
{% load url from future %}
{% load absolute_future %}

{% url "index" %}
{% absolute "index" %}
{% site "index" %}

{% absolute "index" as the_url %}
{{ the_url }}
```

For more informations, see the [Django 1.5 release notes](#).
